

ORENCO SYSTEMS™ SENTINEL I LIQUID LEVEL ALARM

OSI's Sentinel I Liquid Level Alarm provides a reliable, low cost, audio and visual alarm with audio silence. Standard 115 VAC power is converted to Low VDC (6, 9, 12 ... etc.) by a typical plug-in wall transformer. Installation requires no special tools.

The Sentinel I was especially designed for use with a variety of on-site sewage treatment alternatives, such as sand filters, mounds and low pressure or standard drainfields. It may also be used to signal low water or high water conditions in water storage systems, and in ordinary septic tank drainfield applications that are subjected to backups caused by ground water infiltration or soils plugging.

The Sentinel I shall be installed indoors or in a NEMA 1 type environment where the wall plug and receptacle are protected from the weather. The alarm is designed for use with mercury float switches but is compatible with any standard dry-contact switching method.

Note: Commercial installations may require intrinsically safe control relays. Please call for information.
